## Seattle School District No. 1

Grade 10

## Introduction and Overview

This report presents results from the fall 2021 Healthy Youth Survey in Washington State. This survey was sponsored by the Health Care Authority, the Department of Health, the Office of Superintendent of Public Instruction, and the Liquor and Cannabis Board in cooperation with schools throughout the state of Washington.

Survey questions covering the same topics are grouped together when possible but be sure to consult the Questions by Topic index for related questions when searching for information on a specific topic. The numbering in this report is not the same as the question order on the survey itself.

The dot points and graphs included at the beginning of this report highlight selected findings. Additional information may be found in the Interpretive Guide posted to the Healthy Youth Survey web site under Training and Tools: http://www.askhys.net/Reports/Additional.

## Survey Participation in this Report

| Number of students surveyed: | 2,689 |
| :--- | ---: |
| Number of valid responses: | 2,624 |
| Number of enrolled students*: | 3,707 |
| Your survey participation rate**: | $71 \%$ |

* The estimate of enrolled students is based on figures from the 2021-22 school year, provided by OSPI.
** The survey participation rate is the number of valid responses divided by the number of enrolled students.

## Caution about Participation and Bias

Please use the following guidance when reviewing your results:

- $70 \%$ or greater participation-Results are probably representative of students in this grade.
- 40-69\% participation-Results may be representative of students in this grade.
- Less than $40 \%$ participation-Results are likely not representative of students in this grade but do reflect students who completed the survey.

There may be limitations to your results even if you have a high participation rate. For instance, a particular group of students (say, the school orchestra) may have been away from school the day of the survey, and that could bias the results. It is important to acknowledge the potential limitations when using the results in this report. For reports summarizing results at the county or School District level, you should also consider whether the schools that participated represent all students in that area.

## Comparing Results

This report includes a new feature that shows if the local results are different from the statewide results. If local results are significantly different from the state (the confidence intervals do not overlap), there will be an "*" between the two results to note the difference.

In the example below, lifetime marijuana use is significantly lower for local students (9\%) compared to students statewide (16\%).

| 19. Have you ever, even once in your life: <br> Used marijuana? | Your Students <br> $(\mathrm{n}=400)$ | Statewide <br> $(\mathrm{n}=8,500)$ |  |
| :--- | :---: | ---: | ---: |
| a. Yes | $9.0 \%( \pm 3.0)$ | ${ }^{*}$ | $16.0 \%( \pm 1.0)$ |
| b. No | $91.0 \%( \pm 3.0)$ | $*$ | $85.0 \%( \pm 1.0)$ |

## Special Considerations for HYS 2021 and the COVID-19 Pandemic

The COVID-19 pandemic led to several important changes in the usual HYS process and structure that may have an impact on the results. Due to the unexpected shift to primarily remote learning, the HYS was not administered in fall 2020 as it was originally intended. Instead, the HYS Planning Committee determined it would be best to delay the survey to fall 2021. This ensured a process could be created for students who needed to take the survey remotely and it allowed the Planning Committee to add a small number of COVID-19-related questions to support future preparedness and response in schools and communities. In addition, the decision was made to expand e-survey/online survey administration across the state. All of this led to a number of factors that may or may not have had an impact on the results:

1) Delaying the survey by a year means a change in the cohort of students being surveyed. HYS has historically been offered in Fall of even years to students in grades 6, 8, 10 and 12, So, roughly the same cohort of students were ultimately being surveyed every two years as they advanced.
2) The Planning Committee chose to halt plans for a more extensive evaluation of the e-survey mode compared to paper that was scheduled for HYS 2020. Instead, the shift to an e-survey mode without the in-depth comparison makes it more difficult to determine whether the survey mode (paper vs e-survey) has an effect on how students answer questions. Only a very small number of schools elected to do the survey on paper in 2021.
3) Schools were allowed to administer the e-survey remotely in Fall 2021 to accommodate students who may be doing hybrid or fully distanced learning. The vast majority of students took the survey in-person at school, though a small number did take the survey remotely. The potential impact of having students complete the survey remotely is still being assessed.
4) Finally, the pandemic itself has led to massive changes in the lives of Washington youth. Increases and decreases in HYS 2021 data may be more a reflection of the pandemic and its affect on our lives than a change that would have happened if the pandemic had not occurred. This means that trend data from before the pandemic and during/after the pandemic should be interpreted with tremendous caution. For example, a large decrease in one particular risk behavior on school property may be explained by a new school education campaign or program or it may be explained by the fact that students are doing more remote learning.

## Small Numbers: Caution about Number of Students Participating

Results based on small numbers of students answering a question are unstable---that is, they could easily change with the absence from school of only a couple of students. This is especially the case when only a few students choose a particular answer option. Also, in this situation, the reported $95 \%$ confidence interval might be too narrow. Thus, use caution if fewer than 30 students answered a question and fewer than 5 students selected a given response option.

For example, if 20 students answered a question and of those 20 only 3 students answered "Yes", the estimate is unreliable.

See the Understanding Your Report section later in this report for a discussion of "confidence intervals" to help guide your interpretation of the results.

## Key to the Notes

Three versions of the survey were used in the administration of the 2021 HYS. Forms $A$ and $B$ were given to secondary students grades 8,10 , and 12 (and in grades 9 and 11 in some small school districts). Eight questions on sexual orientation, gender identity, sexual behavior, and sexual abuse were asked at the discretion of the school; schools that did not administer the sexual orientation and gender identity questions were required to seek an exemption from the HYS Planning Committee. Form C was given to elementary students in grade 6 (and in grade 7 in some small school districts).

A list of the topics asked and their location in the report are provided in the Questions by Topic section at the end of this report. "Core" questions are asked on both Forms A and B. A list of Core Questions is also found at the end of this report.

The following notes are used throughout this report to document the differences between the questions on different versions and indicate the removable questions on potentially sensitive topics that schools could choose not to administer:
$\mathrm{A}=$ wording on Form $\mathrm{A} ; \mathrm{B}=$ wording on Form $\mathrm{B} ; \mathrm{C}=$ wording on Form C
$\dagger=$ removable questions

Legal requirements: Federal and Washington state regulations prohibit discrimination against LEP individuals who are Deaf, DeafBlind, Hard of Hearing, or visually impaired. Read HCA Policy 01-27 "Language Access Services" and Policy 01-30 "Equal Access to Services for Individuals with Disabilities" for more information. If you have a question about an accommodation, please contact the Healthy Youth Survey study Principal Investigator, at Healthy.Youth@doh.wa.gov or call toll free (877-HYS-7111).

## Understanding Your Results

## N's

In this report " n " is shorthand for "number"---the number of students who took this survey or who answered a survey question. N's are important! We also report the point estimates (\%), and the 95\% confidence intervals (CI).

Here is an example of how results are displayed in the report tables and charts.

## How many students took this survey?

Look on page 2, under Survey Participation. The "number of students surveyed" is the number of surveys that we received. We have careful procedures for "cleaning" to remove surveys with many inconsistent or false answers - the "clean" surveys are the "number of valid surveys". Only valid surveys are presented in this report.

## How many students answered each survey question?

The n's for each question vary. Why? There are several reasons:

- There are two versions of the grades 8,10 , and 12 survey - Form A and B. Core questions are on all versions, so the n's for those questions are about the same as the number of valid surveys. For non-Core questions the n's will be about half, or less.
- Some schools chose to administer the questions about sexual orientation, gender identity, sexual behavior, and sexual abuse. Schools that chose to not ask those additional questions will have no responses for those questions. [District and county reports may include some schools that DID ask those questions and some that DID NOT.]
- Not all students finish the survey, so questions near the end have smaller n's. [NOTE: the order of the questions in the report is not the same as on the survey itself.] Also, some students may decide to skip certain questions.
Here are examples from a district with 400 valid surveys --- notice how the n's change with each question type.

| 25. Have you ever, even once in your life: Used marijuana? | ( $1=398$ ) | ( $\mathrm{n}=4,000$ ) | N for a core question (almost all students) |
| :---: | :---: | :---: | :---: |
| a. Yes | 49.0\% ( $\pm 3.0)$ | 46.0\% ( $\pm 1.0)$ |  |
| b. No | 51.0\% ( $\pm 3.0)$ | 54.0\% ( $\pm 1.0)$ |  |
| 23. Have you ever, even once in your life: Smoked a cigarette, even just a puff? | $(n=200)$ | $(n=2,000)$ | N for a question on only one version (about half the students) |
| a. Yes | 11.0\% ( $\pm 4.0)$ | 12.0\% ( $\pm 2.0$ ) |  |
| b. No | 89.0\% ( $\pm 4.0)$ | 88.0\% ( $\pm 2.0)$ |  |
| 135. Have you ever been in a situation where someone made you engage in kissing, sexual touch or intercourse when you did not want to?! | $(n=100)$ | $(n=1,500)$ | N for an optional sexual behavior question (about half, or less if some schools chose not to ask those questions) |
| a. Yes | 10.0\% ( $\pm 8.0)$ | 8.0\% ( $\pm 4.0)$ |  |
| b. No | 90.0\% ( $\pm 2.0)$ | 92.0\% ( $\pm 1.0)$ |  |

## How many students are we talking about?

N's are only provided for the total number of students who answered a question, not the individual answer options. Some people find it useful to translate their point estimates (\%) into the number of students.

For example, in a district if $10 \%$ of students reported that "Yes" they used inhalants in their lifetime and 200 students answered the questions, then 20 students in the district used inhalants ( $20 \times 0.10$ ).

## Confidence Intervals

It is unlikely that the point estimate (\%) reported for each question is exactly the same as the "true" value for all your students. This report includes $95 \%$ confidence intervals (CI) to describe this uncertainty. If there is no bias in the data, then there is a $95 \%$ chance that the Cl will include the true value. So for example, if the point estimate and Cl are $51.5 \%( \pm 1.5 \%)$, then there is a $95 \%$ chance that the true percentage is between $50.0 \%$ and $53.0 \%$.

The size of your Cls depend in part on the n for each question - as more students answer a question, your point estimate is likely to be closer to the "true" value. If the group of students you're looking at is small, then your Cls will be large. The confidence interval does not take into account the participation rate - in other words, a low participation rate can create bias which will not be reflected in the Cl .

## How can you "use" confidence intervals?

Cls help you to decide if the differences between your students and the state are statistically significant.
For an example, let's say your students report $25 \% \pm 5 \%$. That means that the Cl is between $20 \%$ and $30 \%$ Here is the math: $25 \%-5 \%=20 \%$, and $25 \%+5 \%=30 \%$

Using Cls, you can decide if the difference between your students and the state results are statistically significant:

1. A significant difference:

- Your students report $25 \% \pm 5 \%$, so the point estimate is $25 \%$ and the Cl is $20 \%$ to $30 \%$
- Students statewide report $36 \% \pm 3 \%$, so the point estimate is $36 \%$ and the Cl is $33 \%$ to $39 \%$
- The Cls don't overlap, so the difference is significant

2. Not a significant difference:

- Your students report $25 \% \pm 5 \%$, so the point estimate is $25 \%$ and the Cl is $20 \%$ to $30 \%$
- Statewide students report $28 \% \pm 3 \%$, so the point estimate is $28 \%$ and the Cl is $25 \%$ to $31 \%$
- The Cl for your students overlaps the point estimate for students statewide, so the difference is not significant

3. Not sure if there is a difference:

- Your students report $25 \% \pm 5 \%$, so the point estimate is $25 \%$ and the Cl is $20 \%$ to $30 \%$
- Statewide students report $32 \% \pm 3 \%$, so the point estimate is $32 \%$ and the Cl is $29 \%$ to $35 \%$
- The Cls overlap, but don't include the other point estimates, so you don't know for sure if they are really different without using the significance testing tool described in the next paragraph

More information about interpreting Cls is available on the HYS Training web page at www.AskHYS.net/Training. The Training web page includes past HYS training materials and a "Tool for Determining HYS Statistical Significance". Use the "tool" to find out if your results are significantly different.

## Highlights of the Local Results

Your students and students statewide reported the following behaviors and attitudes:

| Substance Use | Your Students <br> $\%( \pm \mathbf{C I})$ | Statewide <br> $\%( \pm \mathbf{C I})$ |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Smoked cigarettes in past 30 days | $2.2 \%$ | $( \pm 0.6)$ | $1.9 \%$ | $( \pm 0.4)$ |
| Drank alcohol in past 30 days | $14.0 \%$ | $( \pm 1.4)$ | $*$ | $8.4 \%$ |
| Used marijuana or hashish in past 30 days | $9.8 \%$ | $( \pm 1.2)$ | $*$ | $7.2 \%$ |
| Binge drinking in past 2 weeks | $7.1 \%$ | $( \pm 1.0)$ | $5.5 \%$ | $( \pm 1.2)$ |

| Bullying and School Climate | Your Students <br> $\%( \pm$ Cl) |  |  |  |  | Statewide <br> $\%( \pm \mathbf{C l})$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Carried a weapon at school in the past 30 days | $2.8 \%$ | $( \pm 0.7)$ | $2.2 \%$ | $( \pm 0.4)$ |  |  |
| Bullied in the past 30 days | $11.0 \%$ | $( \pm 1.3)$ | $13.3 \%$ | $( \pm 1.4)$ |  |  |
| Enjoyed being at school over the past year | $25.6 \%$ | $( \pm 1.7)$ | $27.0 \%$ | $( \pm 1.6)$ |  |  |
| Felt safe at school | $84.8 \%$ | $( \pm 1.4)$ | $83.0 \%$ | $( \pm 2.1)$ |  |  |

## Selected Results by Sex

Selected survey questions are presented by sex to highlight any differences between females and males.
The p-values reported after each question, calculated from a chi-square test, can be used to examine whether differences between females and males are statistically significant.

A p-value of less than 0.05 means there is a significant difference between females and males (that is, if there really is no difference between females and males, the probability of observing a difference at least this large is less than 5\%).
To ensure student anonymity, we do not report results by sex for any question unless a minimum of students answer each response option. These results are "suppressed".

For your student results by sex, a minimum of 10 students need to answer each response option:
For example, to report smoking cigarettes in the past 30 days for your students by sex - surveys are needed for at least 10 females who smoke, 10 females who don't smoke, 10 males who smoke, and 10 males who don't smoke.

For state results by sex, a minimum of 5 students need to answer each response option.
Results that are suppressed are marked with asterisks "*". Many small counties, districts and schools may not have enough students to report results by sex for all or some questions.

| More than one response selected | $6.0 \%$ | $( \pm 0.9)$ | $5.6 \%$ | $( \pm 0.7)$ |

Some students may select multiple answers to this question so that their response is consistent with how they identify. For example, a student who identifies as a transgender woman may select both female and transgender. This type response is represented in the 'selected multiple responses' category.

| 6. Which of the following best describes you? | ( $\mathrm{n}=2,539$ ) |  |  | ( $\mathrm{n}=8,548$ ) |  |

| f. I don't know what this question is asking | 2.1\% | $( \pm 0.6)$ |  | 2.7\% | $( \pm 0.6)$ |

The next two tables display data on race and ethnicity of participating students. There are different ways to look at these data. Table 7 shows mutually exclusive categories. This means that every student is counted only one time. If a student indicated more than one race or ethnicity, they are included in the bottom row (more than one race/ethnicity marked). Table 7 has been reported in prior HYS reports. Table 8 is new this year and shows the data in non-mutually exclusive categories. This means that each student is counted for every race or ethnicity they indicated. Each category displays the number of youth who indicated they are of that particular race or ethnicity, either alone or in combination with another. Because these are not mutually exclusive categories the total will be more than $100 \%$. The HYS continues to evolve, as do our reporting practices, to focus more on highlighting student identity and limiting erasure of students with multiple identities.

## Alcohol, Tobacco and Other Drug Use

Alcohol, tobacco, and other drug (ATOD) use has been a major concern in this country for many years. The consequences of ATOD use are well known. In the short term, ATOD use interferes with positive physical, emotional, and social development. In the long term, ATOD use is associated with delinquency and criminal activity, unintended injuries, and a variety of health complications including shorter life expectancy. Tobacco use is the world's leading cause of preventable death, disease, and disability. This section provides information about lifetime ATOD use (which in part reflects experimental use), use in the past 30 days (i.e., current use), and other tobacco-, alcohol-, and drug-related issues.

## Other Health Concerns

## Nutrition and Fitness

This section provides results regarding other health concerns including nutrition and fitness, health conditions and health care, safety, behaviors related to intentional injury, and depression. Proper nutrition and exercise are critical components of a healthy life, as is access to preventive health care. Safety-related behaviors can profoundly influence the outcome of an accident. Injury is the leading cause of death for adolescents aged 10 to 19, and violence contributes to injury-related deaths. People who are depressed experience a range of symptoms, and depression is associated with suicidal behavior.

Obese: "Obese" includes students who are in the top $5 \%$ for body mass index by age and gender based on growth charts developed by the Centers for Disease Control and Prevention (2000). "Overweight" includes students who are in the top $15 \%$ but not the top $5 \%$.

Hope reflects a future orientated mindset and motivational process by which an individual has an expectation toward attaining a desirable goal. Research has linked hope with overall physical, psychological, and social well-being. This section introduces the Children's Hope Scale, an assessment of agency (ability to initiate and sustain action towards goals) and pathways (capacity to find a means to carry out goals).

## Washington Healthy Youth Survey - Adverse Childhood Experiences Scale (WAH-ACEs)

Eleven questions from the HYS were selected to be included in the WAH-ACEs score based on review of public health, social work, and psychology literature on adverse experiences among children, youth and young adults and the association with short and long-term effects on their health and wellbeing. These questions addressed the topics identified in the literature review, including intimate partner violence, physical or sexual abuse by an adult, safety in school, bullying, and financial hardship, among other topics. Some adverse experiences identified in the literature were not captured in HYS questions and could therefore not be included in WAH-ACEs (e.g., neglect).

For each question, a student could get a value of 0 or 1 and these were added up to create their final score. Sometimes students did not answer all questions on the survey; the WAH-ACEs score accounts for any missing answers to give schools and districts a more precise picture of what their students are experiencing. For more information about the WAH-ACEs, please see WAH-ACEs Interpretive Guide.

## Risk and Protective Factors

Decades of research have shown that certain risk factors are associated with increased likelihood of health risk behaviors including ATOD use, violence, and delinquent behaviors. Similarly, research from Drs. Hawkins and Catalano and associates at the University of Washington, has shown that protective factors exert a positive influence against the negative influence of risk factors. The premise of the risk reduction and protective factor enhancement approach to prevention is that preventing a problem before it occurs requires addressing the factors that predict the problem. Ideally, this strategy entails discovering the causes of the problem behavior and influencing those causes. Many of the survey questions were used to assess students' status on risk and protective factors in the community, school, and peer-individual domains. Composite scales were computed for use in local program planning.

## Risk and Protective Factor Scale Results and Graphs

For each risk factor scale, the percentage of students who are at risk (i.e., who agreed with statements that predict ATOD use or other problem behaviors) is reported; higher percentages indicate that more students are likely to engage in problem behaviors. For each protective factor scale, the percentage of students who are resilient (i.e., who agreed with statements that predict the ability to resist ATOD use or other problem behaviors) is reported; higher percentages indicate that fewer students are likely to engage in problem behaviors. These percentages are based on computational methods provided by the University of Washington's Social Development Research Group.
